this book presents a readable and accessible introductory course in algebraic geometry with most of the fundamental classical results presented with complete proofs an emphasis is placed on developing connections between geometric and algebraic aspects of the theory differences between the theory in characteristic and positive characteristic are emphasized the basic tools of classical and modern algebraic geometry are introduced including varieties schemes singularities sheaves sheaf cohomology and intersection theory basic classical results on curves and surfaces are proved more advanced topics such as ramification theory zariski s main theorem and bertini s theorems for general linear systems are presented with proofs in the final chapters with more than 200 exercises the book is an excellent resource for teaching and learning introductory algebraic geometry

matrix algebra has been called the arithmetic of higher mathematics be we think the basis for a better arithmetic has long been available but its versatility has hardly been appreciated and it has not yet been integrated into the mainstream of mathematics we refer to the system commonly called clifford algebra though we prefer the name geometric algebra suggested by clifford himself many distinct algebraic systems have been adapted or developed to express geometric relations and describe geometric structures especially notable are those algebras which have been used for this purpose in physics in particular the system of complex numbers the quaternions matrix algebra vector tensor and spinor algebras and the algebra of differential forms each of these geometric algebras has some significant advantage over the others in certain applications so no one of them provides an adequate algebraic structure for all purposes of geometry and physics at the same time the algebras overlap considerably so they provide several different mathematical representations for individual geometrical or physical ideas

derived algebraic geometry is a far reaching generalization of algebraic geometry it has found numerous applications in various parts of mathematics most prominently in representation theory this volume develops the theory of ind coherent sheaves in the context of derived algebraic geometry ind coherent sheaves are a renormalization of quasi coherent sheaves and provide a natural setting for grothendieck serre duality as well as geometric incarnations of numerous categories of interest in representation theory

this volume consists of three parts and an appendix the first part is a survey of homotopical algebra in the setting of infinity categories and the basics of derived algebraic geometry the second part builds the theory of ind coherent sheaves as a functor out of the category of correspondences and studies the relationship between ind coherent and quasi coherent sheaves the third part sets up the general machinery of the infinity 2category of correspondences needed for the second part the category of correspondences via the theory developed in the third part provides a general framework for Grothendieck's six functor formalism the appendix provides the necessary background on infinity 2categories needed for the third part
